## “Effect of pore pressure on geological structures: Sandbox experiments and numerical modelling”

**Dra. Adeline Pons**

Laboratory Physique et Mécanique des Milieux Hétérogènes (PMMH), Paris, France

Fluids are present in various geological structure and the effects of them can influence the localization of the deformation (main faults). Here, we are interested in the effect of fluid over-pressures on the global stability of accretionary prisms but also on the localization of the deformation (main faults). Both experimental and numerical approach of this problem are presented.
